

A Synthetic Study of Woven Paper Titles for Readers Without Metadata

Ada Example and Ben Sample

Abstract

Readers often register papers whose files carry no title metadata at all. The library then shows the file name, such as an archive number, instead of the title printed on the first page. We show that the largest text in the upper half of that page is the title in the papers we examined, and that stamps in the margin are narrow enough to set aside. A short check against the body size keeps ordinary pages from producing false titles.
