

Paperloom Extraction Sample

1 Introduction

Paperloom keeps the source text of every page so that a later search finds the alphaword passage on the right page and the compositional parts of the layout stay attached to their original coordinates on the page.

A second paragraph starts with an indented line and mentions the fixture word with a ligature and the betaword marker so the search can find both of them.

2 Two Column Section

The left column opens with the gammaword paragraph that runs over several short lines in a narrow column of text.

Another paragraph in the left column holds the deltaword term.

The right column is drawn first in the content stream but it holds the epsilonword paragraph that a reader reaches after the left column.

Its second paragraph holds the zetaword term near the bottom.

Each task t_k has period T_k and x^2 term etaword

Rotated page iotaword

Landscape text with the omicronword marker runs
upward on the page.
